

Group Updates — Owner Setup Checklist

JOSHUA: A French Quarter Bear Tale · one-time setup, about 10 minutes

1. Create the routines on claude.ai (required — no coding, no terminal)

The update rounds are **Claude Code Routines**: scheduled cloud sessions that run on your Claude Pro/Max subscription. You create them in your browser at claude.ai/code/routines (or in the Claude desktop app: Routines → New routine → Remote). No API key, no command line.

- **Open the form** — Go to claude.ai/code/routines → **New routine**. If asked, connect your GitHub account so Claude can access the repo.
- **Name + instructions** — Name it “Group updates — 8 AM”. Into the Instructions box, paste the prompt from the repo file **updates/ROUTINE-PROMPT.md** (open it on GitHub and copy everything below the line). Pick your preferred model in the prompt box.
- **Repository** — Add **jbvyvf67cb-ai/wutang-arcade**.
- **Permissions tab** — Enable **Allow unrestricted branch pushes** for the repo — the routine must push to the default branch so the game deploys.
- **Trigger** — Schedule → Daily → 8:00 AM (times are in your local timezone).
- **Repeat ×3** — Create three more routines with the same prompt and repo, scheduled daily at 2:00 PM, 8:00 PM, and 12:00 AM.

Runs bill your subscription's usage allowance (same pool as your own Claude Code sessions) and count against a daily routine-run cap — empty-queue rounds exit in seconds and cost almost nothing. Commits and pushes appear as *your* GitHub account.

2. Invite your group (required — the repo is private)

- **Invite collaborators** — github.com/jbvyvf67cb-ai/wutang-arcade → Settings → Collaborators → Add people. Give them **Write** access so they can drop files into `updates/queue`.
- **No GitHub account?** — They create a free one first — the player guide covers it.

3. Run one end-to-end test (recommended)

- **Queue a small request** — Repo → `updates/queue` → Add file → Create new file → name it `test.txt`, write something small (“add one extra coin trail on Royal Street”), commit.

-
- **Trigger a round now** — claude.ai/code/routines → open the 8 AM routine → **Run now**. Click the run to watch the session live.
-

- **Verify (10–30 min later)** — The live game updated; your file moved to `updates/processed/<timestamp>/` next to a `SUMMARY.md`; the queue is empty again.

4. Share with the group

- **Player guide (public link)** — <https://jbvyvf67cb-ai.github.io/wutang-arcade/HOW-TO-GUIDE.pdf>
-
- **The repo** — <https://github.com/jbvyvf67cb-ai/wutang-arcade> (they add requests here)
-
- **The game** — <https://jbvyvf67cb-ai.github.io/wutang-arcade/>

5. Ongoing (light touch)

- **Check the runs list** — claude.ai/code/routines shows every run. Green only means the session finished — open a run's transcript to see what was actually done. Failed or skipped rounds leave the queue intact; requests are picked up next round.
-
- **Mind your usage** — Track consumption at claude.ai/settings/usage. Each non-empty round draws from your plan like a session you ran yourself; rounds also count against a daily routine-run cap.
-
- **Audit trail** — Every round writes `updates/processed/<timestamp>/SUMMARY.md` explaining what changed and why.
-
- **Pause / run on demand** — Each routine's page has a pause toggle and a Run now button.

Schedule: 8 AM, 2 PM, 8 PM, midnight — entered in your local timezone in the routine form. Runs may start a few minutes late (scheduling stagger is normal).

Branch note: the routines push to (and the game deploys from) the default branch — leave the default branch as-is and everything stays lined up.
